Computer Architecture

Cache Memory

ARASH HABIBI LASHKARI
(April- 2010)

Characteristics

- Location
- Capacity
- Unit of transfer
- Access method
- Performance
- Physical type
- Physical characteristics
- Organisation

Location

- CPU
- Internal
- External

Capacity

- Word size
  - The natural unit of organisation
- Number of words
  - or Bytes

Unit of Transfer

- Internal
  - Usually governed by data bus width
- External
  - Usually a block which is much larger than a word
- Addressable unit
  - Smallest location which can be uniquely addressed
  - Word internally
  - Cluster on M$ disks

Access Methods (1)

- Sequential
  - Start at the beginning and read through in order
  - Access time depends on location of data and previous location
  - e.g. tape
- Direct
  - Individual blocks have unique address
  - Access is by jumping to vicinity plus sequential search
  - Access time depends on location and previous location
  - e.g. disk

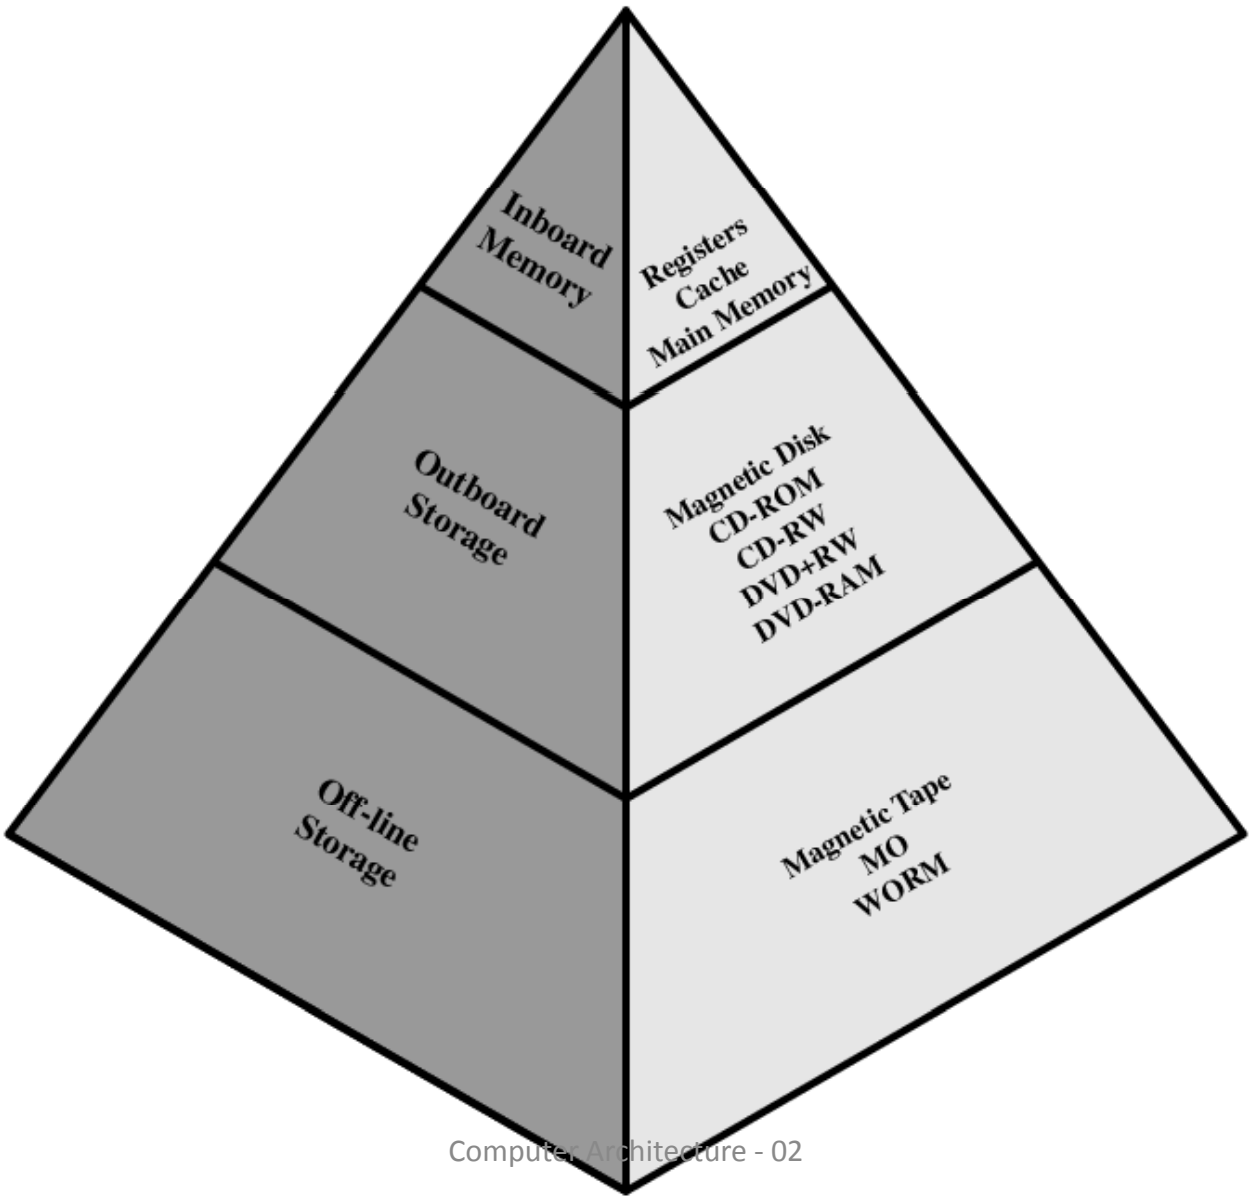
Access Methods (2)

- Random
  - Individual addresses identify locations exactly
  - Access time is independent of location or previous access
  - e.g. RAM
- Associative
  - Data is located by a comparison with contents of a portion of the store
  - Access time is independent of location or previous access
  - e.g. cache

Memory Hierarchy

- Registers
  - In CPU
- Internal or Main memory
  - May include one or more levels of cache
  - “RAM”
- External memory
  - Backing store

Memory Hierarchy - Diagram



Performance

- Access time
  - Time between presenting the address and getting the valid data
- Memory Cycle time
  - Time may be required for the memory to "recover" before next access
  - Cycle time is access + recovery
- Transfer Rate
  - Rate at which data can be moved

Physical Types

- Semiconductor
  - RAM
- Magnetic
  - Disk & Tape
- Optical
  - CD & DVD

Physical Characteristics

- Decay
- Volatility
- Erasable
- Power consumption

Organisation

- Physical arrangement of bits into words
- Not always obvious
- e.g. interleaved

The Bottom Line

- How much?
  - Capacity
- How fast?
  - Time is money
- How expensive?

Hierarchy List

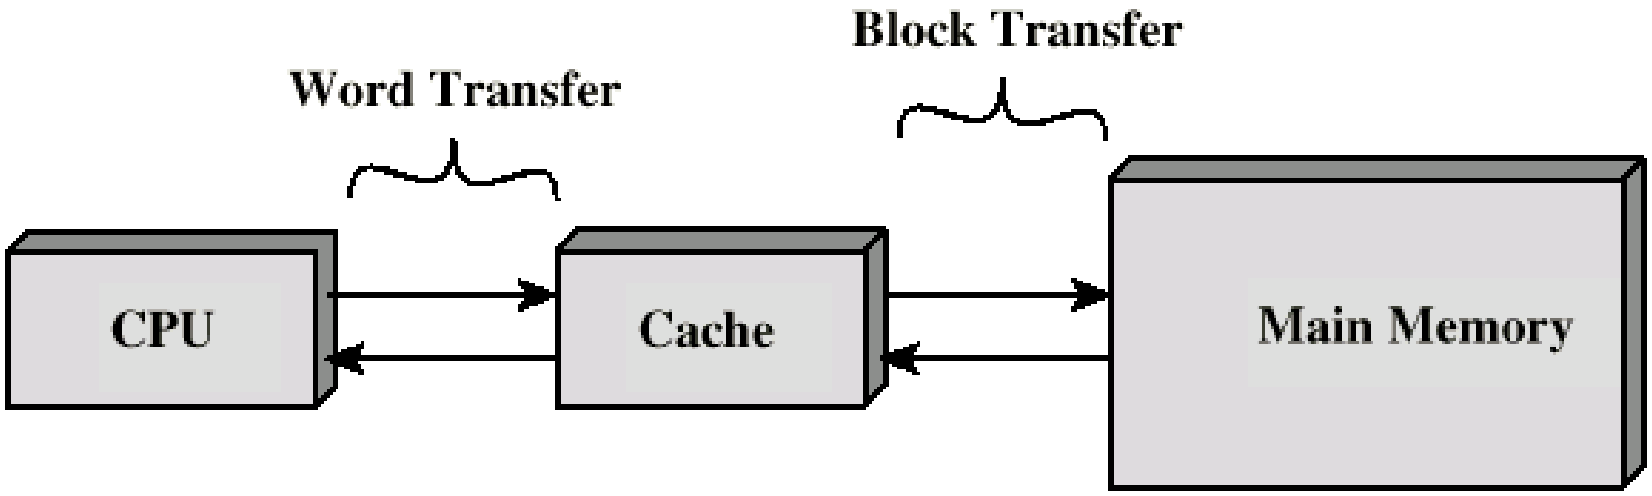
- Registers
- L1 Cache
- L2 Cache
- Main memory
- Disk cache
- Disk
- Optical
- Tape

So you want fast?

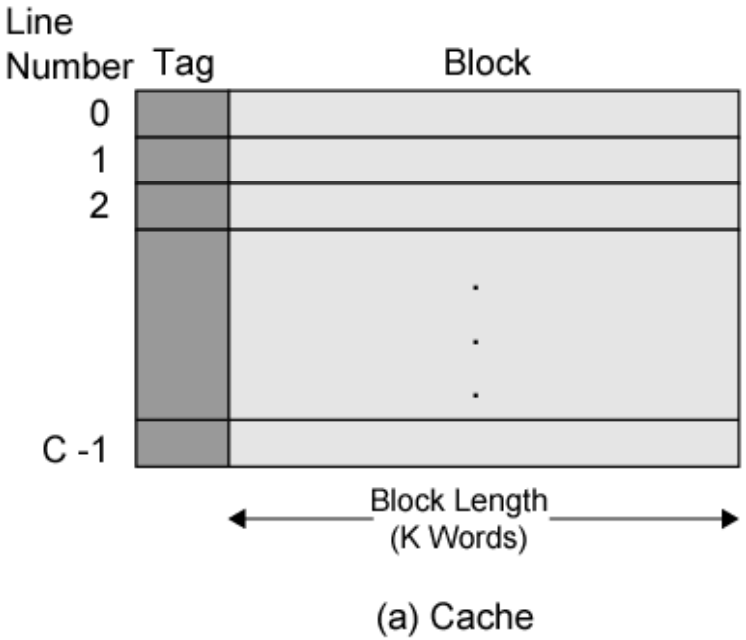
- It is possible to build a computer which uses only static RAM (see later)
- This would be very fast
- This would need no cache
  - How can you cache cache?
- This would cost a very large amount

Cache

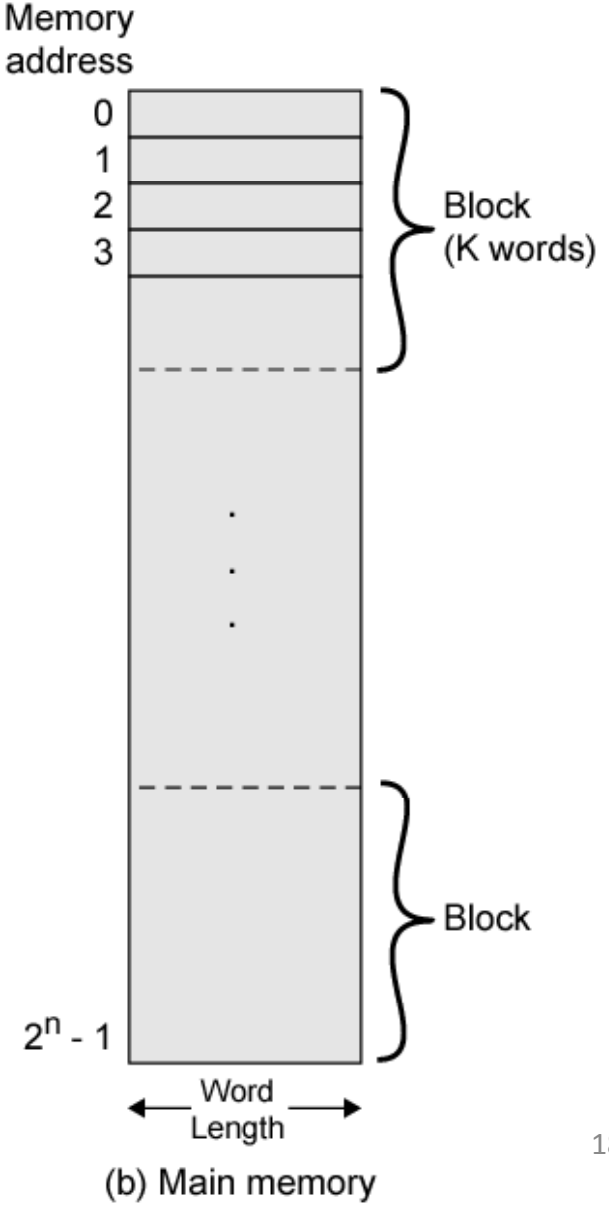
- Small amount of fast memory
- Sits between normal main memory and CPU
- May be located on CPU chip or module



Cache/Main Memory Structure



(a) Cache

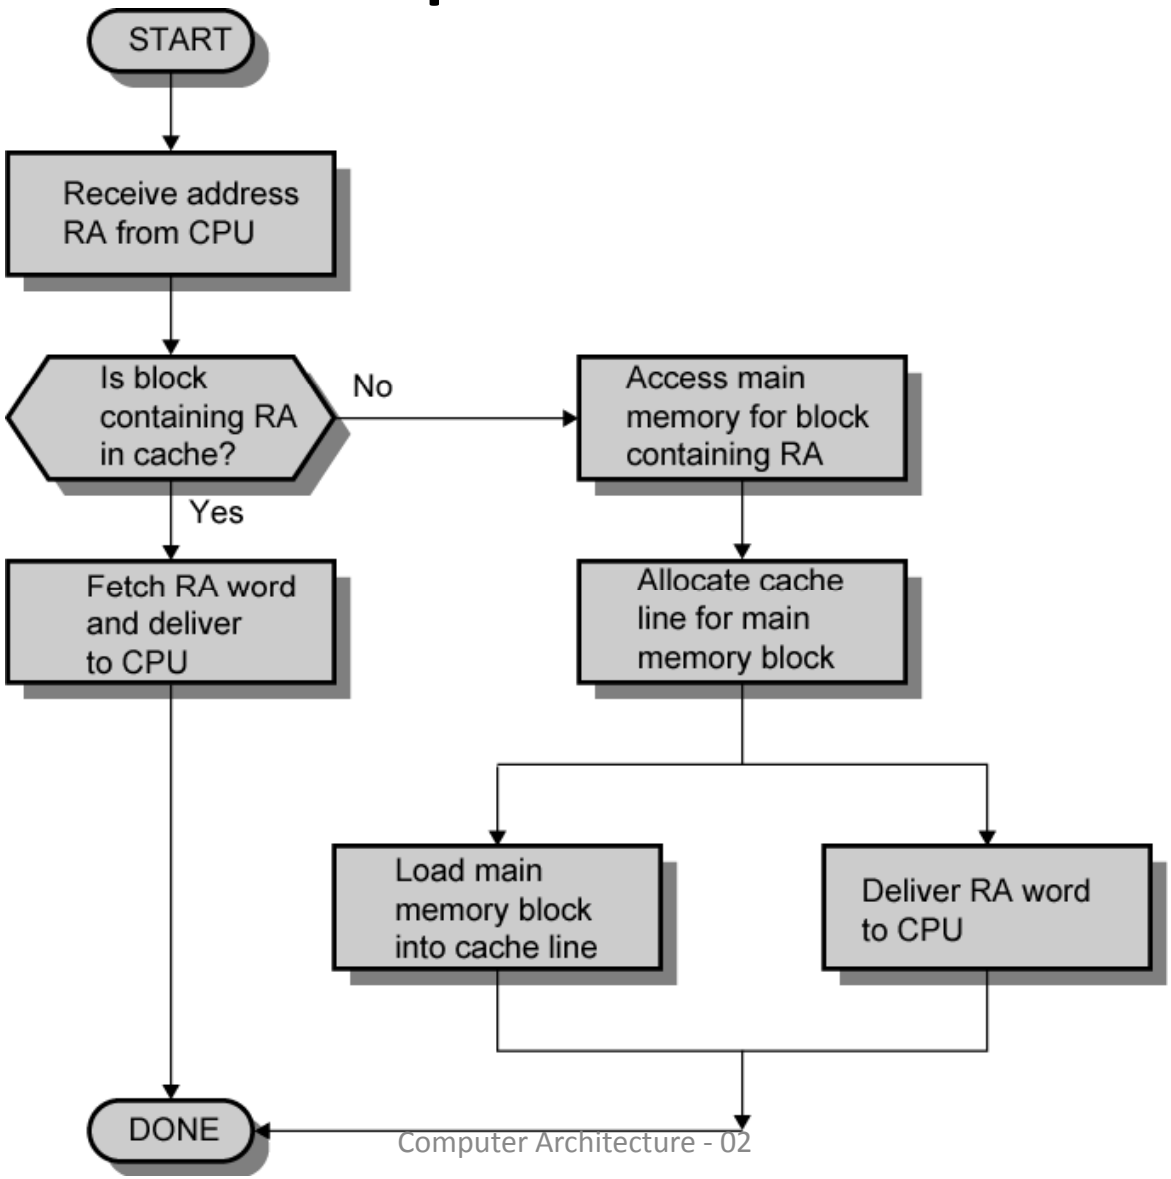


(b) Main memory

Cache operation – overview

- CPU requests contents of memory location
- Check cache for this data
- If present, get from cache (fast)
- If not present, read required block from main memory to cache
- Then deliver from cache to CPU
- Cache includes tags to identify which block of main memory is in each cache slot

Cache Read Operation - Flowchart



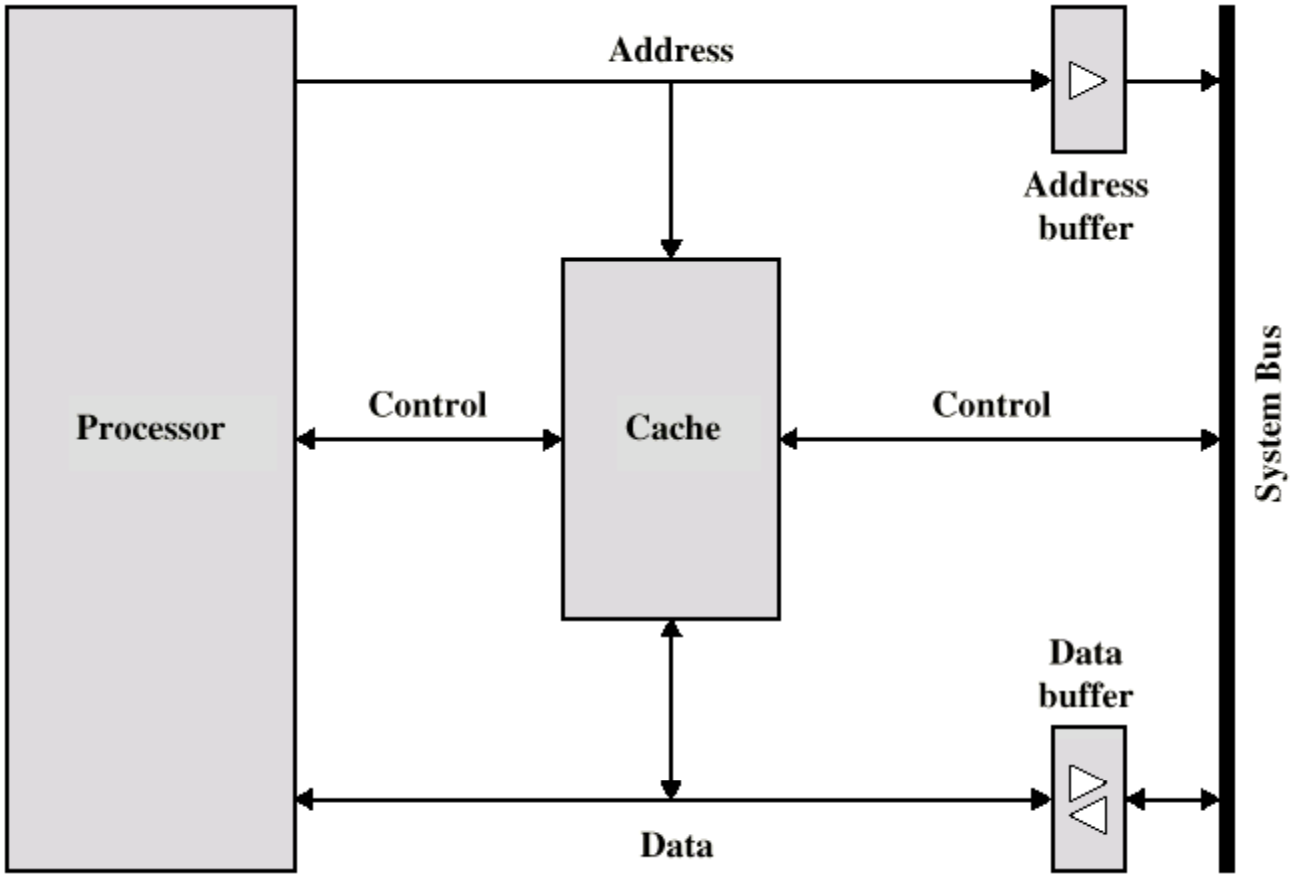
Cache Design

- Size
- Mapping Function
- Replacement Algorithm
- Write Policy
- Block Size
- Number of Caches

Size does matter

- Cost
  - More cache is expensive
- Speed
  - More cache is faster (up to a point)
  - Checking cache for data takes time

Typical Cache Organization



Mapping Function

- Cache of 64kByte
- Cache block of 4 bytes
  - i.e. cache is 16k (2^{14}) lines of 4 bytes
- 16MBytes main memory
- 24 bit address
  - (2^{24}=16M)

Write Policy

- Must not overwrite a cache block unless main memory is up to date
- Multiple CPUs may have individual caches
- I/O may address main memory directly

Write through

- All writes go to main memory as well as cache
- Multiple CPUs can monitor main memory traffic to keep local (to CPU) cache up to date
- Lots of traffic
- Slows down writes

- Remember bogus write through caches!

Write back

- Updates initially made in cache only
- Update bit for cache slot is set when update occurs
- If block is to be replaced, write to main memory only if update bit is set
- Other caches get out of sync
- I/O must access main memory through cache
- N.B. 15% of memory references are writes

Pentium 4 Cache

- 80386 – no on chip cache
- 80486 – 8k using 16 byte lines and four way set associative organization
- Pentium (all versions) – two on chip L1 caches
  - Data & instructions
- Pentium III – L3 cache added off chip
- Pentium 4
  - L1 caches
    - 8k bytes
    - 64 byte lines
    - four way set associative
  - L2 cache
    - Feeding both L1 caches
    - 256k
    - 128 byte lines
    - 8 way set associative
  - L3 cache on chip
